What is Cassandra?

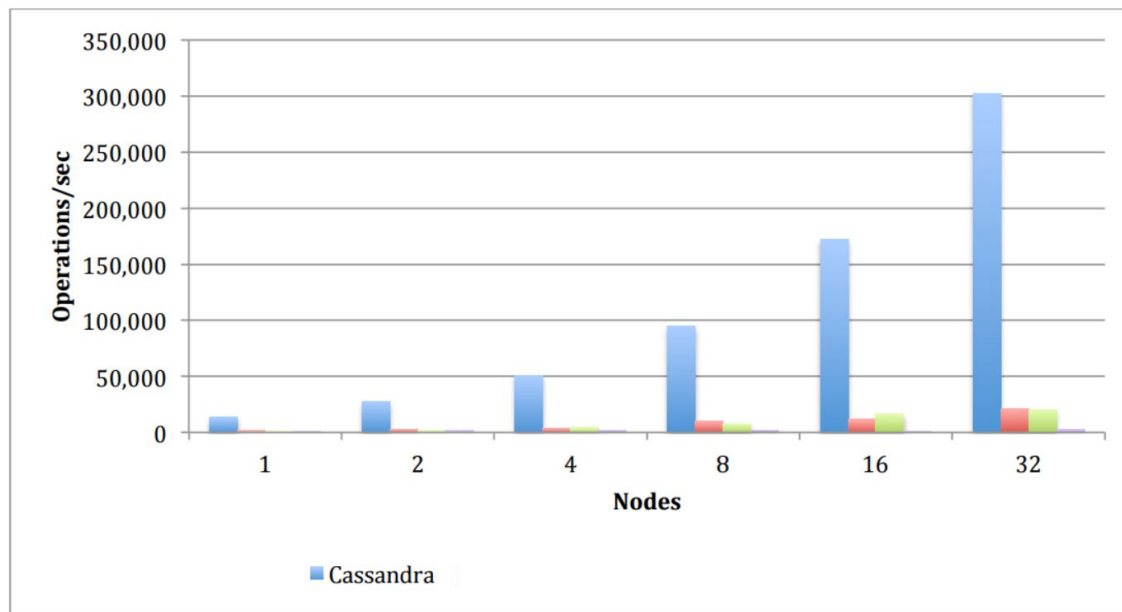

Why is it such a hot topic?

- Cassandra is a highly scalable peer-to-peer NoSQL database with zero downtime
- Cassandra generally requires a schema
- Data is organized based on expected queries instead of in data tables
- Setup/configuration can be challenging
- Does not use SQL, rather CQL

Apache Cassandra™ = NoSQL Distributed Database

Balanced Read/Write Mix

Apache Cassandra™ Big Names

Apache Cassandra @ Netflix

- 98% of streaming data is stored in Apache Cassandra
- Data ranges from customer details to viewing history to billing and payments
- Foundational datastore for serving millions of operations per second

- 30 million ops/sec on most active single cluster
- 500 TB most dense single cluster
- 9216 CPUs in biggest cluster

$O(100)$ Clusters
 $O(10000)$ Instances
 $O(10,000,000)$ Replications per second
 $O(100,000,000)$ Operations per second
 $O(1,000,000,000,000,000)$ Petabytes of data

Apple Scale

- 160K+ Apache Cassandra Instances
- 100+ PB stored
- Several million ops / sec
- 1000s of clusters

What is Stargate?

- Open Source project adding interfaces to Cassandra
- Stargate exposes your Cassandra data via HTTP APIs
- The REST API gives a resource-driven interface similar to CQL
- The Document API allows you to store arbitrary structured data together
- The GraphQL API gives you the ability to support descriptive queries.
